PERSONAL ACADEMIC PORTFOLIO

Website Project Brief & Implementation Guide

Student: Joseph Okologo

Programme: Computer Science

Institution: MIVA Open University

Purpose: To present an academic profile, showcase projects and skills, and manage academic activities through an interactive website.

PROJECT OVERVIEW

This project is a responsive academic portfolio and student management website built with HTML, CSS and JavaScript. It is designed to present a student's profile professionally while demonstrating core front-end development skills.

1. Homepage

The homepage introduces the student and includes a profile photograph, welcome message, navigation menu, brief biography and a professional layout.

2. About Me Page

This page presents educational background, career aspirations, technical skills, hobbies and interests. It helps visitors understand the student's academic journey and professional direction.

3. Projects Page

The projects page contains at least three sample projects, each with a description, image or screenshot, and a real or simulated project link.

• Academic Portfolio Website — a personal profile and academic information site.

• Student Task Planner — an interactive task manager for assignments and study activities.

• Contact Form Validator — a form that checks user input with JavaScript.

4. Academic Planner Page

The planner uses JavaScript to add tasks, mark tasks as completed and delete tasks. An array stores task objects while DOM manipulation updates the displayed task list. Browser storage can be used to preserve tasks between visits.

5. Contact Page

The contact form includes name, email address, phone number and message fields. JavaScript validation checks that no field is empty, the email address follows a valid format and the phone number contains digits only.

TECHNICAL REQUIREMENTS CHECKLIST

Area	Evidence to demonstrate
HTML	Semantic elements, forms, tables, images, hyperlinks, lists and multimedia.
CSS	External stylesheet, responsive layout, Flexbox and/or Grid, styled navigation, transitions/animations, consistent colours and mobile support.
JavaScript	Event handling, DOM manipulation, form validation, dynamic updates, arrays, functions and interactive task management.

PUBLISHING AND SUBMISSION

• Create a GitHub repository named academic-portfolio.

• Upload the website files, including the HTML pages, external CSS stylesheet, JavaScript file and image assets.

• Enable GitHub Pages in the repository settings and wait for the site to publish.

• Test all pages, navigation links, planner actions, form validation and mobile layout.

• Submit both the live website URL and the GitHub repository URL.

IMPLEMENTATION NOTES

The contact form requires a backend or a form service to deliver messages to an inbox; client-side validation alone does not send messages. The multimedia requirement should be completed by adding a real video or audio source. Replace simulated project links with working links where possible.
